

第4図．地震群に新しい地震が加わった時，その順番（横軸）とその前震確率（縦軸）．前震（単発を含む）が赤線で，本震以後の予測確率が青線．その他の群れ（本震余震型または群発地震型）が灰色線．横の点線は複数の場合の前震の全国平均（7.2%）．

Fig.4. Foreshock probability forecasts of each cluster at each time when a member is updated, where red color segments indicates foreshocks, including single foreshocks. Then, blue segments shows the probability forecasts after the mainshock. Gray color segments indicate that the clusters were other type, namely mainshock-aftershock sequence or swarm-type. Horizontal dashed line indicates the unconditional foreshock probability (7.2%) in case where we have plural events in a cluster.
