CONTENTS

Laurens de Haan (Erasmus University & University of Lisbon) 1
Introduction to extreme value theory

Hsien-Kuei Hwang (Institute of Statistical Science Academia Sinica) 12
Maxima in multivariate samples: a selected survey

Nobutane Hanayama (Shobi University)
Masaaki Sibuya (Keio University) 33
A discussion of the limit of human longevity based on data for oldest-old survivors

Shigenobu Tanaka (International Centre for Water Hazard and Risk Management) 40
Water-related mega disasters in Japan and climate change impacts

Masaaki Sibuya (Keio University)
Rinya Takahashi (Kobe University) 50
Analysis of tsunami magnitude data set

Toshikazu Kitano (Nagoya Institute of Technology) 61
Properties of the log-transformed occurrence rate

Laurens de Haan (Erasmus University & University of Lisbon) 67
Natural disasters

Laurens de Haan (Erasmus University& University of Lisbon) 76
Multidimensional EVT and max-stable processes

Satoshi Kuriki (ISM) and Xiaoling Dou (ISM) 88
Tail probability of linear combinations of chi-square variables and its application to influence analysis in QTL detection

Takaaki Shimura (ISM) 100
Law of large random numbers

Tatsuhiko Saigo (University of Yamanashi) 108
Max semiselfdecomposable distributions and their properties

Hiroe Tsubaki (ISM) 114
Another interpretation of bathtub curve, quantitative and qualitative aspects of risk factors

Hiroaki Komatsu (Japan Real Estate Institute)
Naoki Makimoto (University of Tsukuba) 119
Extreme value analysis of auction data of used apartments

Laurens de Haan (Erasmus University & University of Lisbon) 133
Estimation of the marginal expected shortfall

Jun Kanda (Nihon University) 146
Preparedness for extremely rare hazard events
